Amy:

As far as I know we have never had to deal with it in the past. I can tell you that I will not collect it and put it in frac tanks, sample it, and dispose of it. There is just too much volume and no end in site since I get alot every time it rains. The material will either be discharged into the sanitary sewer or I will just let it continue to release to the storm sewer untreated. If I feel there is a threat that it will release to the residential community to the south, I will actively discharge it to the storm sewer untreated although not my preference. The sanitary sewer is the only real alternative that I have.

Thanks

Gary Moore

How have we dealt with contaminated water in the past at other removals?
